"Days NOT Months"

EXECUTIVE SUMMARY

Mid-size UK fintechs are losing engineering velocity to legacy core banking systems that take 18 months to update. Roll the Code's flagship Orchestration System reverses this: we apply architect-supervised, multi-layered agentic AI to reverse-engineer your legacy codebase, produce a validated modern specification, and deliver a production-ready replacement in weeks — not months. Deterministic results. Fixed price. No lock-in. Start with one non-critical module and expand with confidence.

The Situation

Your legacy core banking system is not the problem. The 18-month update cycle is.

Mid-size UK fintechs are caught between regulators demanding faster change and legacy architectures that make change brutally expensive. Every sprint against a monolithic core burns engineering capacity, delays product roadmaps, and compounds technical debt. The firms that modernise first — in 2026 — will carry the architectural advantage for the next decade.

18mo
AVG. TIME TO UPDATE A CORE BANKING MODULE

60–70%
ENGINEERING CAPACITY LOST TO LEGACY MAINTENANCE

6–9mo
WINDOW BEFORE EARLY MOVERS PULL AHEAD

What We Do

We apply our flagship **Orchestration System** to reverse-engineer, specify, and rebuild legacy banking components at speed.

- **Reverse-engineer your legacy system** — AI pipeline reads your existing codebase and produces a clean, modern technical specification. Static analysis, dependency mapping, behaviour extraction — in days.
- **Generate a validated replacement** — deterministic, architect-supervised AI implementation. Not vibe coding. Not a prototype. Production-grade output against the validated spec.
- **Deploy to your stack** — tech-stack agnostic, deployment agnostic. Your infrastructure, your compliance boundaries, your rules.
- **Start non-critical, expand with confidence** — begin with a self-contained module to prove the approach internally before touching mission-critical rails.

> *"Days NOT Months" — a module that would take your team 18 months to refactor is deliverable in weeks.*

Results

Scenario	Legacy Situation	RTC Outcome
Reporting module	6-month internal project	Delivered in under 4 weeks
Enterprise integration	Stalled 12+ months	Unblocked by reverse-engineering spec in days
Discovery-to-spec	Months of architectural archaeology	Reduced to days across multiple engagements

Client names withheld. Available under NDA on request.

How We Work Together

Step 1 Scoping Call	Step 2 Build	Step 3 Deploy & Hand Over
45 minutes. Map the target module, assess codebase complexity, define fixed scope. Clear timeline and price. No open-ended engagement.	Orchestration pipeline executes reverse engineering, spec generation, and implementation. Senior architects supervise every milestone. You approve before we proceed.	Production-ready code, documented and tested. Deployed to your infrastructure. Full handover to your team. No retainer, no lock-in.

Pricing: €50K–€200K for mid-size non-critical solutions. Fixed scope, fixed price. Proposal within 5 working days of scoping call.

Why Roll the Code

Our Orchestration System was built by software architects with decades of enterprise delivery experience:

- **Gábor Tatár** — AI orchestration product owner, software architect, 20+ years enterprise delivery
- **Ákos Karacs** — QA, business analyst, software architect; built the determinism layer of our pipeline
- **Roland Repka** — senior full-stack developer, production delivery
- **Steve Balogh** — enterprise IT adviser

SignCoders is our cooperation partner — a social enterprise employing Deaf and hard-of-hearing professionals in mixed Deaf–hearing tech teams — for agentic AI implementation and UX/UI. They add genuine technical depth and a diversity story that resonates with enterprise procurement. Not a subcontractor. A partner.

This is not a thin AI wrapper over a code generator. It is a multi-layered, deployment-agnostic, agentic AI pipeline that produces deterministic, production-grade results — because software architects, not prompt engineers, designed it.

Use Cases for UK Fintech

Module	Legacy Pain	RTC Outcome
Reporting & analytics layer	Manual extraction, stale data, core DB coupling	Modern API-connected reporting — weeks
Onboarding & KYC workflow	3rd-party dependencies, compliance drift	Clean reimplementation — spec + build
Payment reconciliation	Monolithic logic, untestable edge cases	Modular, testable replacement

Key Takeaways

- Your 18-month update cycle is a delivery problem, not an architecture problem — and it is solvable now
- We reverse-engineer, specify, and rebuild legacy modules in weeks using deterministic, architect-supervised AI orchestration
- Start with one non-critical module at a fixed price — prove it, then expand
- The window is 6–9 months before early movers in AI-assisted modernisation have pulled decisively ahead
- One 45-minute scoping call. A fixed-scope proposal within 5 working days. No risk to start.
