DECK OVERVIEW

This is the full pitch deck with speaker notes for a CTO presentation at a mid-size UK fintech. The deck runs 10 slides and is designed for a 20–30 minute presentation, either in-person or via screen share. The core message: Roll the Code's Orchestration System can reduce an 18-month legacy banking modernisation to weeks — deterministically, with fixed price, starting from one non-critical module. Speaker notes below each slide provide context, anticipated objections, and recommended emphasis points.

SLIDE 1

TITLE

Modernise Your Core Banking System. In Weeks, Not Years.

Roll the Code — AI Agent Factory

> *"Days NOT Months"*

Presented by Antal Károlyi, PhD · Co-founder & Board Member · April 2026

> **Speaker notes:** *Open with the tension. This CTO has lived through a failed or stalled legacy modernisation. Don't start with the solution — start with the recognition. Say: "You've probably sat in a meeting where someone said this refactor will take 18 months. We've built something specifically for that problem." The tagline is not a slogan — it's the summary of everything you're about to show them.*

SLIDE 2

THE PROBLEM

18 months to update a core banking module. That's not an architecture problem. That's a delivery crisis.

18mo
AVG. MODULE UPDATE CYCLE

60–70%
ENGINEERING CAPACITY LOST TO MAINTENANCE

Compounding
TECHNICAL DEBT PER SPRINT

- UK mid-size fintechs spend the majority of engineering capacity **maintaining legacy systems**, not building the product their customers need
- Regulators demand faster change; **every sprint against the monolith** compounds risk and costs more than the last
- The longer you wait, the further competitors who are acting now will pull ahead

Speaker notes: *Let the 18-month stat land. Don't rush past it. Ask them directly: "What's currently blocked because of your core system?" This opens the room. The CTO will tell you. That's the module you'll be pitching Phase 1 against. Note: if your specific prospect has a different number — use theirs. This is their pain, not a generic statistic.*

SLIDE 3

THE SOLUTION

We reverse-engineer your legacy system, generate a modern spec, and deliver a production-ready replacement — in weeks.

Our Orchestration System:

- **Read your codebase at scale** — static analysis, dependency mapping, behaviour extraction
- **Generate a validated modern specification** — human-readable, architect-reviewed, immediately actionable
- **Implement with deterministic AI orchestration** — multi-layered, architect-supervised, production-grade
- **Deploy to your stack** — tech-stack agnostic, deployment agnostic. Your infrastructure, your rules

> ***Not vibe coding. Architect-supervised. Deterministic results.***

> **Speaker notes:** *Stress "deterministic" — this single word separates us from every other AI shop the CTO has already dismissed. They've heard "AI-powered development" before and they're sceptical. The key differentiator is that this was built by software architects as a system, not assembled from AI tools by enthusiasts. If they ask how it works technically, that's the signal to go deeper — but don't lead with tech.*

SLIDE 4

HOW IT WORKS

Three phases. Fixed scope at every gate.

Phase	What Happens	Timeframe
Phase 1: Reverse Engineering	AI pipeline analyses the legacy codebase — static analysis, dependency mapping, behaviour extraction. Output: a clean, modern technical specification. You review and approve.	Days
Phase 2: Implementation	Agentic AI orchestration builds the replacement against the validated spec. Senior architects supervise every output. Milestone approval before proceeding to deployment.	Weeks
Phase 3: Deploy & Hand Over	Production-ready code, fully documented and tested. Deployed to your infrastructure. Full handover to your team — no lock-in, no retainer required.	Your timeline

Speaker notes: *Emphasise that Phase 1 alone has unblocked stalled projects. We have had clients who purchased Phase 1 — the reverse-engineering and spec — and then executed Phase 2 internally with their own team. The spec alone has commercial value. This reduces the perceived risk of the engagement considerably. Also note: "milestone approval before proceeding" is a control mechanism for the CTO, not a courtesy — it's contractual.*

SLIDE 5

RESULTS

What this looks like in practice.

Scenario	Legacy Situation	RTC Outcome
Reporting module	Planned as a 6-month internal refactor	Delivered in under 4 weeks
Enterprise integration	Stalled for 12+ months, no internal owner	Unblocked by reverse-engineering spec in days
Discovery-to-spec phase	Months of architectural archaeology	Reduced to days across multiple engagements

Client names withheld. Available under NDA on request.

> **Speaker notes:** *These are real outcomes — we don't inflate numbers. If the CTO pushes back ("give me a client name"), acknowledge the NDA constraint and offer to arrange a reference call. The key point is specificity: "under 4 weeks" is verifiable, not "significantly faster." If you have a closer analogue to their specific module by the time of the meeting, use that instead. The more specific to their problem, the more credible the result.*

SLIDE 6

USE CASES

Start non-critical. Expand with confidence.

Module	Legacy Pain	RTC Outcome
Reporting & Analytics Layer	Manual extraction, stale data, core DB coupling, no API layer	Modern API-connected reporting layer — delivered in weeks
Onboarding & KYC Workflow	3rd-party dependencies, untestable integrations, compliance drift	Clean reimplementation — full spec + build, testable and auditable
Payment Reconciliation	Monolithic logic, manual overrides, untraceable edge cases	Modular, testable replacement — built from a reverse-engineered spec

Speaker notes: *The non-critical entry point is the most important element of the sales motion. It de-risks the decision for the CTO and gives them internal proof to show their board or risk function before committing to higher-value systems. Ask: "Which of these three modules maps closest to what you have stalled right now?" Then move toward the scoping conversation.*

SLIDE 7

WHY NOW

The window is 6–9 months.

- AI-assisted software delivery has moved from **experiment to production** across UK enterprise in 2025–2026
- UK fintech firms acting in 2026 will carry the **architectural advantage** for the next decade
- Regulatory pressure — FCA, Basel, DORA — is **increasing the cost of stale systems** with each passing quarter
- Early movers are already reducing legacy maintenance costs and **accelerating feature velocity**
- Waiting means handing the initiative to **competitors who are moving now**

> ***The question is not whether to modernise. It's whether you lead or follow.***

> **Speaker notes:** *Urgency here is real, not manufactured. We're 12–18 months into the AI delivery curve. The early window is genuinely closing. Frame this as a strategic decision, not a vendor selection. The CTO who acts in Q2 2026 has a meaningfully different outcome than the one who waits for internal sign-off until Q4. Don't be alarmist — be factual. The regulatory pressure from DORA in particular is a concrete forcing function worth mentioning by name.*

SLIDE 8

WHY ROLL THE CODE

Architects who built a system. Not prompt engineers with a deck.

Name	Role	Relevant Depth
Gábor Tatár	AI Orchestration Lead	Product owner of the Orchestration System. Software architect. 20+ years enterprise delivery.
Ákos Karacs	QA & Architecture	Built the determinism and quality layer of our pipeline. Business analyst and software architect.
Roland Repka	Senior Full-Stack	Production delivery. Translates orchestration output into deployable, maintainable, documented code.
Steve Balogh	Enterprise IT Adviser	Enterprise IT advisory — ensures every engagement is commercially sound and enterprise-viable.

SignCoders — our cooperation partner — is a social enterprise employing Deaf and hard-of-hearing professionals in mixed Deaf–hearing tech teams. They provide agentic AI implementation and UX/UI. Genuine technical depth. A diversity story that matters to enterprise procurement. Not a subcontractor — a partner.

> **Speaker notes:** *The CTO needs to know there are real engineers behind this — mention Gábor and Ákos by name and by specific credential. The question they'll be forming internally: "Are these people who could sit in a technical review with my architects?" The answer is yes. SignCoders is a genuine differentiator for enterprise procurement, especially in UK financial services where supplier diversity is increasingly scrutinised.*

SLIDE 9

THE OFFER

A low-risk starting point. A high-impact outcome.

Proposed Engagement:

- **Scoping call (45 min)** — map target module, define fixed scope, agree timeline
- **Fixed-scope proposal** — delivered within 5 working days
- **Pilot delivery** — one non-critical module, fixed price, milestone-based
- **Expand on success** — further modules under a separate fixed-scope agreement

Pricing:

€50K–€200K	Weeks	Fixed
MID-SIZE NON-CRITICAL SOLUTIONS	DELIVERY TIMEFRAME	SCOPE AND PRICE — NO T&M

Fixed scope. Fixed price. No open-ended retainer. If the pilot delivers — and we expect it to — expansion is a conversation, not a commitment.

> **Speaker notes:** *Don't leave the meeting without booking the scoping call. The pilot structure removes the "what if it fails" objection — fixed price means their downside is capped. Fixed scope means there's no scope creep risk. The "expand on success" language is deliberate — it puts the CTO in control of the next decision, which reduces procurement anxiety. If they ask about the €50K–€200K range, the answer is: "The scoping call gives us the information to fix the number precisely within that range."*

SLIDE 10

CONTACT

Start with 45 minutes. Not 18 months.

Antal Károlyi, PhD Co-founder & Board Member · Roll the Code

- rollthecode.io
- LinkedIn: /in/antalkarolyi

> *"Days NOT Months"*

One scoping call. A fixed-scope proposal within 5 working days. A pilot on one non-critical module that proves the approach before you commit to anything larger.

> **Speaker notes:** *Close with the tagline. It's not a slogan — it's the one-sentence summary of everything you've just shown them. The ask is minimal: one 45-minute call. If they say "we need to think about it," offer to send the one-pager and follow up in 5 working days. If they ask for a case study, offer an NDA-protected reference. If they ask about procurement process, offer to route through their preferred channels — we can adapt the contract structure.*

Deck Summary — Key Messages for the CTO

- Your 18-month update cycle is a delivery problem, not an architecture problem — and it is solvable now
- Our Orchestration System reverse-engineers, specifies, and rebuilds legacy modules in weeks — deterministically, with fixed price
- This was built by software architects with decades of enterprise experience — not prompt engineers
- Start with one non-critical module. Prove the approach. Expand with confidence.
- The window is 6–9 months. The firms that act in 2026 carry the architectural advantage for a decade.
- One 45-minute scoping call. Fixed-scope proposal within 5 working days. No risk to start.
